1 PURPOSE OF THIS PROPOSAL

This preliminary proposal presents the SHIELD concept and the equipment Strategic Defense offers to supply. It is a basis for technical discussion with the Office of the Special Adviser, not a final offer.

The final proposal will follow a site survey. It will confirm exact quantities, locations, and schedule.

2 BACKGROUND AND OUR UNDERSTANDING

Nigeria's security challenge is less a lack of information than a failure to move it from collection to action in time. Agencies hold intelligence, but sharing is slow and field units often cannot act on it together.

The Office of the Special Adviser to the President on Homeland Security, created in May 2026, exists to close that gap through intelligence integration, inter-agency coordination, and proactive risk management. It builds on the Intelligence Fusion Centre established under the Office of the National Security Adviser, which already brings the major security agencies together in Abuja.

The next step is to extend that coordination to where threats occur: the land borders and the scene of a crisis. Two practical gaps stand out:

- a. **Unwatched borders.** Long stretches of land border have no persistent surveillance, so illegal crossings go undetected.
- b. **Agencies that cannot talk.** Police, military, and paramilitary units use different radio systems and cannot communicate directly at an incident.

Neither gap can be closed by the military alone. Security is shared by the whole of government and society, in line with the comprehensive approach of Nigeria's 2019 National Security Strategy: the police, customs, immigration, civil defence, emergency services and communities each play a part alongside the armed forces. What they need is less uncertainty: knowing who is moving, where, when and how, early enough to act before harm is done.

SHIELD addresses both with equipment, delivered and working, not with further studies.

3 THE SHIELD CONCEPT

Strategic Defense offers to deliver two of the five homeland security priorities: border monitoring and management, and joint emergency response. SHIELD places both inside the full picture so that every item supplied fits the national effort.

Priority	Meaning	Scope
Priority 1	See everything in one place: one live operational picture at the national level	Not in scope; SHIELD feeds are delivered in open formats ready to connect
Priority 2	Know who's who: identity checks against the national ID system	Not in scope; border posts are prepared to host ID devices
Priority 3	Monitor and manage the borders: continuous monitoring and management of land borders	IN SCOPE - PACKAGE A
Priority 4	Warn early: detecting threats before they happen	Not in scope
Priority 5	Respond together: agencies acting as one team in a crisis	IN SCOPE - PACKAGE B

Two principles guide the design:

- a. **Shared picture, not shared command.** Each agency keeps its mandate and chain of command. SHIELD gives them the means to see and talk to each other.
- b. **Build on what exists.** SHIELD extends the existing coordination structure rather than creating a new one.

4 PACKAGE A - BORDER MONITORING AND MANAGEMENT

Package A gives the agencies that manage Nigeria's land borders a clear, continuous view of what crosses them. The main users are the Nigeria Customs Service, the Nigeria Immigration Service, the Police and the Nigeria Security and Civil Defence Corps, working alongside the military where needed.

The aim is not only to stop threats. It is also to protect border communities, curb smuggling and human trafficking, and let legitimate trade and travellers move more safely and quickly.

The pilot covers a section of the South-West border with Benin, one of Nigeria's busiest trade corridors, and expands to other sections once proven. The exact section, for example along the main road corridors and the bush crossings between them, will be fixed during the site survey.

4.1 How it works

1. **Detect:** radar and ground sensors pick up people and vehicles crossing away from official posts, day and night.
2. **Verify:** the nearest camera turns toward the alert, so an operator can see what it is before anyone is sent, which avoids wasted patrols and false alarms.
3. **Share:** video and alerts reach the control room, where all border agencies work from the same picture, and on to national level.
4. **Respond:** the agency best placed to deal with the situation acts, whether a customs team, an immigration officer, a police unit, or a military patrol for armed threats.

4.2 Equipment

Monitoring towers

Masts with day, night and thermal cameras and detection radar, covering open and bush terrain.

Ground sensors

Buried sensors along known unofficial crossing routes that alert when someone passes.

Border post upgrades

CCTV, vehicle barriers and gates, and space, power and network ready for ID devices.

Joint border control room

A room near the border where staff from all border agencies monitor cameras and sensors together.

Tower power

Solar panels with battery storage, independent of the grid.

Communications links

Radio and satellite links carrying video and alerts to the control room and onward.

Mobile monitoring units

Vehicles with a camera and radar mast, moved to where crossing patterns shift.

Portable observation kits

Portable day and night cameras carried by border officers to cover gaps between towers.

Vehicle and cargo scanning

X-ray scanners so customs can inspect vehicles and cargo for contraband without unloading, speeding up legitimate trade.

Site protection

Fencing and controlled entry around border posts and the control room.

5 PACKAGE B - JOINT EMERGENCY RESPONSE AND COMMUNICATIONS

Package B helps every agency that responds to an emergency work as one team at the scene. That includes the police, civil defence, fire service, NEMA and state emergency agencies, the Federal Road Safety Corps, health services and, where needed, the military. Emergencies include not only attacks and kidnappings but also floods, building collapses, major road accidents, fires and large public events.

5.1 How it works

At any major incident, responders arrive on their own radio networks and cannot talk to each other. The radio bridging equipment links those networks, so the incident commander can open a shared channel for all responders in minutes, without anyone changing radios.

The mobile incident command vehicle becomes the on-scene coordination point. Agency leads plan together inside it, with a satellite link to national level. If phone networks are down, as often happens in floods or large incidents, the emergency communication kits keep the scene connected.

5.2 Equipment

Radio bridging equipment

Gateways linking the radio systems of different agencies, fixed at coordination centres and portable for the field.

Mobile incident command vehicle

One equipped vehicle with radios, bridging equipment, satellite link, displays and a meeting space for agency leads.

Emergency communication kits

Satellite phones and portable satellite terminals for when phone and internet networks fail.

Deployable coordination shelters

Quick-erect shelters with lighting and power for longer operations or places a vehicle cannot reach.

Standby power

Generators and battery packs for the vehicle, shelters and kits.

Mobile relay masts

Portable masts with secure radio relay, extending coverage into remote areas.

6 DESIGN PRINCIPLES

All SHIELD equipment is chosen against six principles:

- a. **Technology-neutral:** no brand is fixed in advance; equipment is selected against performance requirements.
- b. **Open standards:** video, data, and radio interfaces use recognised standards, so SHIELD connects to national systems and avoids lock-in to a single supplier.
- c. **Modular and scalable:** the pilot section and first vehicle form a template that can be copied to other border sections and zones.
- d. **Built for the environment:** equipment is rated for heat, humidity, heavy rain, and dust.
- e. **Independent power:** towers and field sites run on solar and batteries; command equipment carries its own backup.
- f. **Secure:** links are encrypted, equipment is hardened against tampering and cyber attack, and access is controlled.

7 IMPLEMENTATION APPROACH

SHIELD is delivered in steps, with a live demonstration within roughly the first 3 months. Timings run from contract signature and export-license approval, and are approximate.

Step 0 - Site survey and design

Timing: First weeks. Survey the pilot border section and command sites; confirm the final equipment list and installation design.

Step 1 - Launch and demonstration

Timing: Roughly 3 months. Equipment ordered and export licenses applied for; live demonstration of radio bridging with participating agencies.

Step 2 - Interoperable communications

Timing: Roughly 6-9 months. Radio bridging equipment and emergency communication kits delivered, installed, and handed over.

Step 3 - Incident command vehicle and border pilot

Timing: Roughly 9-15 months. Mobile incident command vehicle delivered; pilot border section installed and operational.

Step 4 - Expansion

Timing: After Step 3. Further border sections and response units, based on pilot results.

8 TRAINING AND SUSTAINMENT

Strategic Defense trains the people who use SHIELD and keeps the equipment running.

- a. **Operator training:** control room staff, vehicle crews, and radio operators, on the equipment they use.
- b. **Technician training:** first-line maintenance and fault-finding for local technical staff.
- c. **Train-the-trainer:** Nigerian instructors certified to train new personnel.
- d. **Maintenance and spares:** a multi-year support period with preventive maintenance, a spare parts pool, and local technical staff.

9 WHY STRATEGIC DEFENSE

Strategic Defense is a Nigerian-registered company based in Abuja, with an NCAGE code, supplying and integrating security systems for police, customs, immigration, emergency services, paramilitary services, armed forces, and government agencies.

- a. **Relevant capability:** border and perimeter surveillance, vehicle-mounted and portable observation systems, secure communications and relay masts, command vehicle fit-out, checkpoint screening, and command-centre equipment.
- b. **Established manufacturer network:** Strategic Defense represents leading international manufacturers under executed agreements, and selects the system that suits the operating environment rather than a single brand.
- c. **One point of accountability:** site survey, procurement and export documentation, shipping and customs, installation and integration with existing cameras and radios, training, and through-life support, all under one contract.
- d. **Knowledge of Nigerian institutions:** engagements with the Nigerian Air Force mean SHIELD is designed around how Nigerian agencies actually operate, and can link with air surveillance assets where the client wishes.

10 NEXT STEPS

Strategic Defense proposes three steps toward a final proposal:

1. A meeting with the Office of the Special Adviser to present SHIELD and answer questions.
2. Agreement on the pilot border section and the participating agencies.
3. A site survey, leading to the final technical proposal with confirmed quantities, locations, and schedule.

End of Preliminary Technical Proposal SDSS/SHIELD/PTP/001 v1.0
